

INSTALLING A CODE EDITOR

A code editor is an application used to write a program for a specific programming language – in this case, Python. There are several code editors out there. Such are, VS Code, Sublime Text, PyCharm, Atom, Notepad ++ and more.

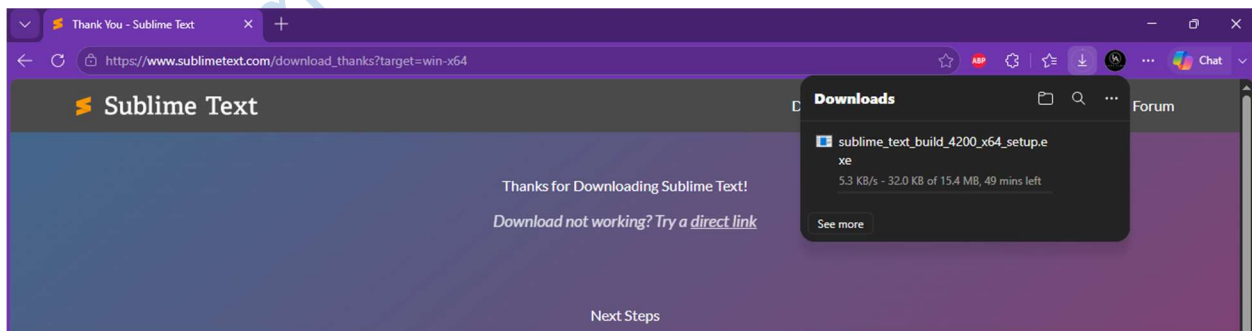

If you have any of these code editors, you need not install another one. If not, I'd recommend you install **Sublime Text**. Sublime Text is a versatile code editor with support of numerous languages like C++, C#, Java, Python, JavaScript, etc. It is also lightweight meaning it consumes very little RAM while running your programs unlike editors like VS Code.

Steps to Install Sublime Text

Click on this link: [Download - Sublime Text](https://www.sublimetext.com/download)

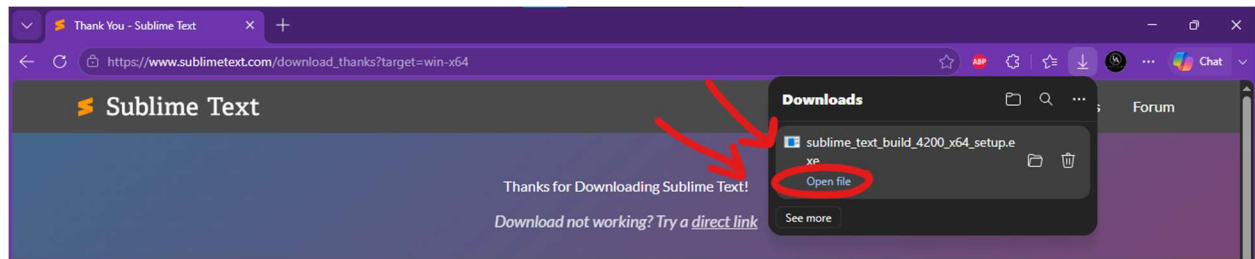

Click on **Windows** and Sublime Text should start downloading right away.

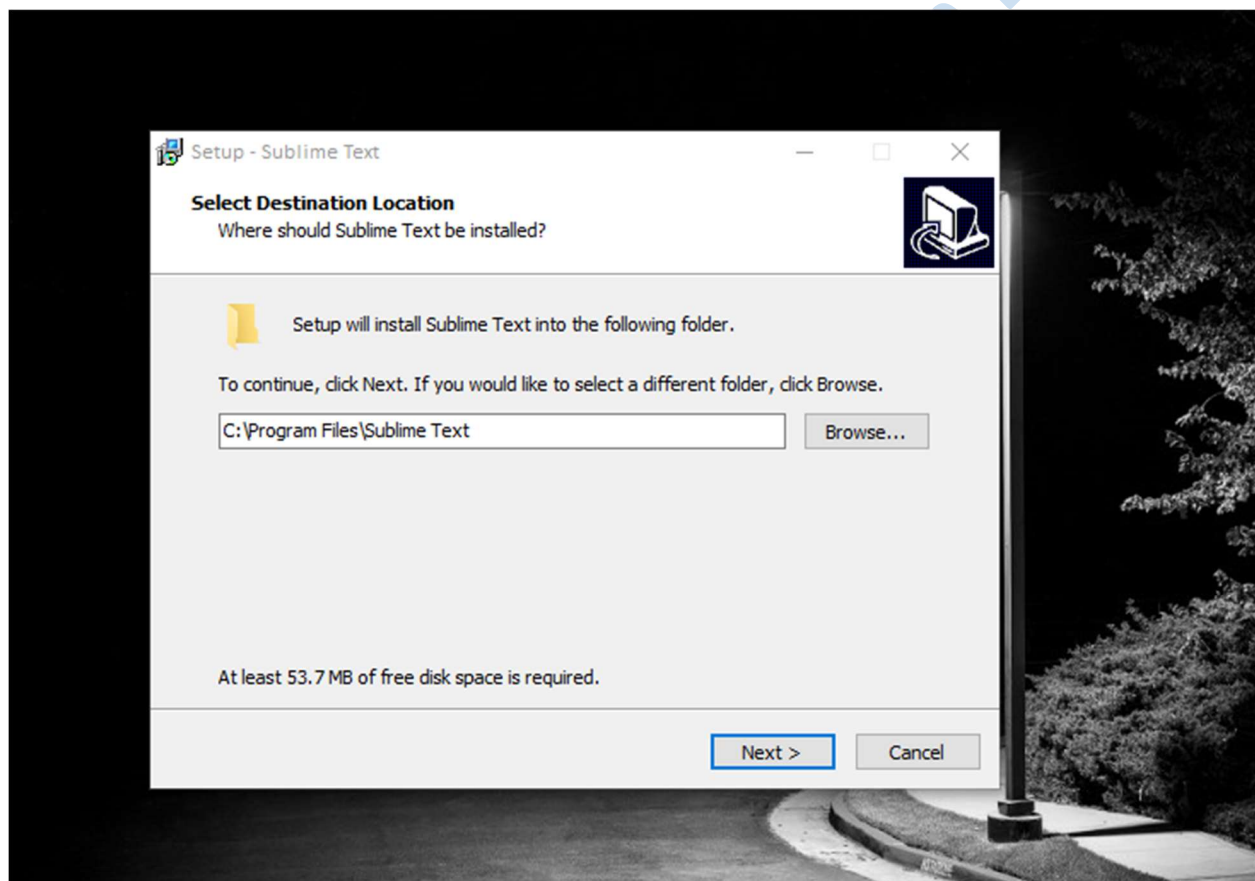

Wait for the download to complete then click on **Open File**.

FROM BASICS TO JUNIOR PYTHON DEV: Code Editor Installation

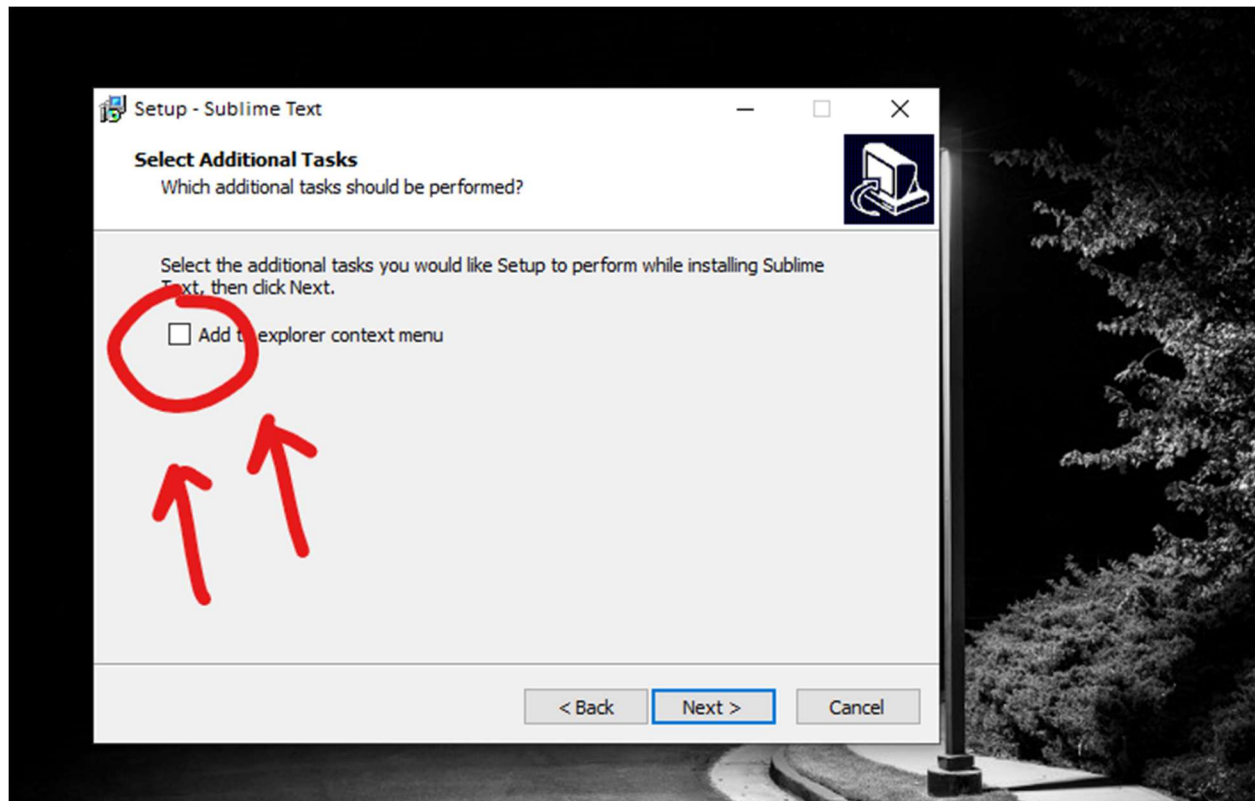

After clicking open, a window will pop up asking whether you allow the app to make changes to your device. Click **Yes** and this window should pop up.

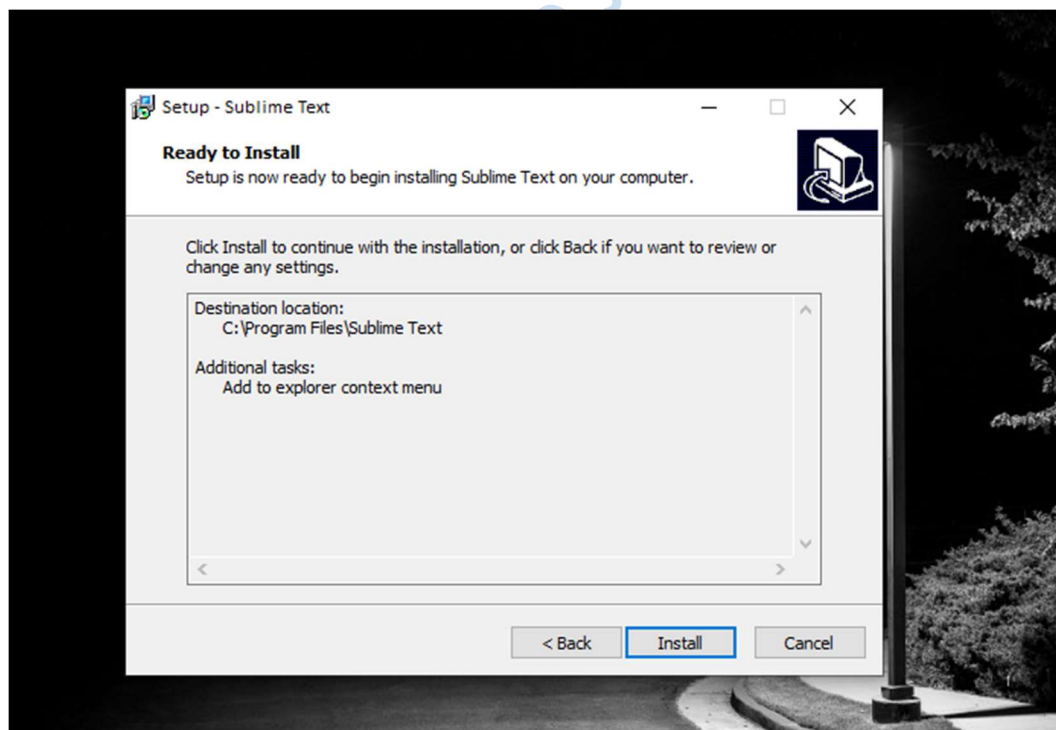

On this window, click **Next**.

FROM BASICS TO JUNIOR PYTHON DEV: Code Editor Installation

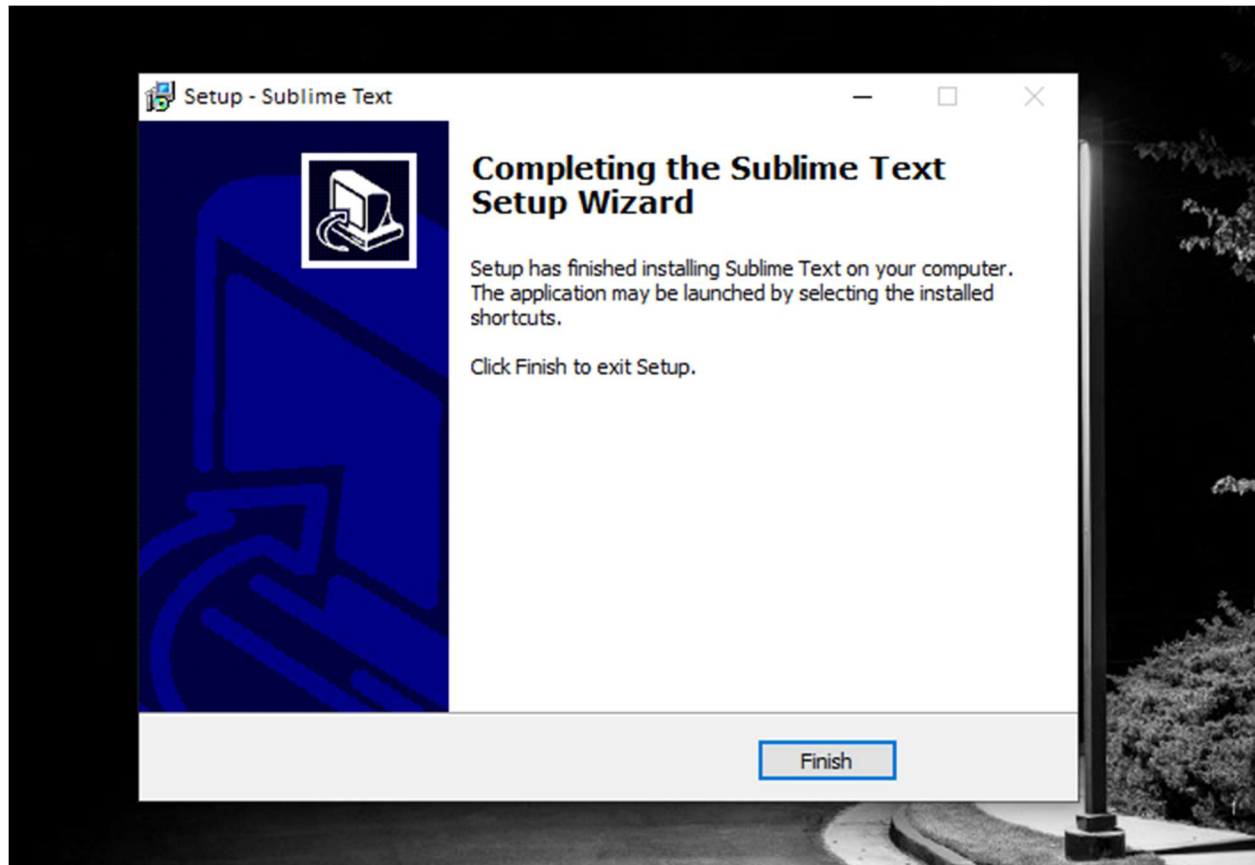

Tick ☒ Add to explorer menu then hit Next.

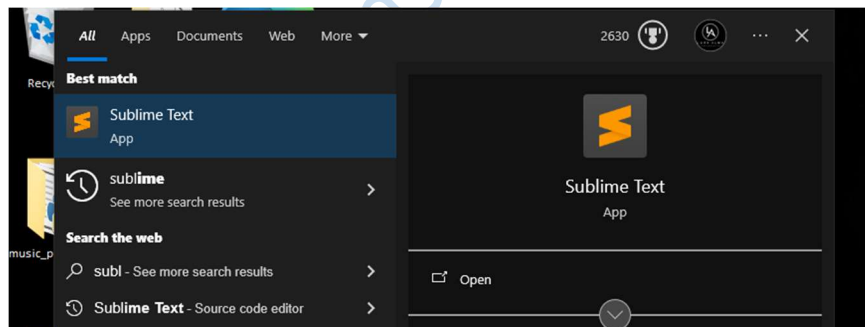

FROM BASICS TO JUNIOR PYTHON DEV: Code Editor Installation

Click Install and wait until Installation is complete.

Click **Finish** to exit the Setup. To confirm Installation, click windows button and type 'Sublime Text'.

If you have this, then Sublime Text was successfully installed. You can open it and familiarise yourself with the application.
